

BABY CORN THAI GOLD

NEW BABY CORN VARIETY FOR THE FRESH MARKET

- Excellent uniform yellow colour cobs
- Early maturing
- Excellent grade-out
- Suitable for fresh market pre pack and processing
- Very high yielding

Type

Baby corn variety for fresh market pre pack and processing.

Category: Standard

Maturity

Early maturing approximately 75 - 85 days after planting. This will vary by as much as 10 days between winter and summer plantings. For accurate planning heat units should be monitored.

Plant Characteristics

Plants are very uniform, reaching a height of 2.20m, with ears positioned 170 cm above the ground.

Ear characteristics: THAI GOLD has very high quality tender ears with excellent colour. Ears are extremely uniform that results in a very high pack out percentage.

Variety Characteristics

Plant Population: Under optimal conditions (well managed fields with adequate watering) a plant population of 60,000 – 80,000 plants are seen as ideal.

Climate Requirements: Baby corn can be grown under a range of climatic conditions. These conditions can vary from moderate, cool climates to more subtropical regions. It is important to note that even distribution of heat units is a key requirement for optimal production of corn.

Features & Benefits

THAI GOLD offers the baby corn grower the opportunity to supply various markets with produce of the highest quality. The variety stands out on uniformity, quality and has some of the highest yields.

Disclaimer: This information is based on our observations and/or information from other sources. As crop performance depends on the interaction between the genetic potential of the seed, its physiological characteristics, and the environment, including management, we give no warranty express or implied, for the performance of crops relative to the information given nor do we accept any liability for any loss, direct or consequential, that may arise from whatsoever cause. Please read the Starke Ayres Standard Terms and Conditions of Sale before ordering seed.

Resistance: is the ability of a plant variety to restrict the growth and development of a specified pest or pathogen and/or the damage they cause when compared to susceptible plant varieties under similar environmental conditions and pest or pathogen pressure. Resistant varieties may exhibit some disease symptoms or damage under heavy pest or pathogen pressure (HR = High resistance, IR = Intermediate resistance).
